

Continuing Education Courses & Curriculum

Carlisle SynTec Systems recognizes that continuing education in single-ply systems is crucial to advancing and improving the commercial roofing industry. CCM University offers on-demand e-Learning courses, many of which are accredited for AIA, IIBEC and/or GBCI continuing education credits, that can be taken by industry professionals looking to gain knowledge on single-ply and building envelope systems.

Carlisle SynTec has courses to fit your learning preference, including Lunch & Learn programs, e-Learning courses, and webinars with live Q&A sessions.

Visit CCM University to see the extensive e-Learning course collection, schedule a Lunch & Learn, or to review the upcoming webinar schedule. Learn more about CCM University by visiting the website: www.ccm-university.com/syntec

COURSE AVAILABILITY

Lunch & Learn

Schedule a free in-office Lunch & Learn and a Carlisle SynTec Representative will bring in lunch and deliver an AIA registered continuing education course. To identify the AIA course, browse the catalog and look for the icon shown to the left.

When you're ready to book your Lunch & Learn, [click here](#) or visit the link below:

www.ccm-university.com/syntec/syntec/event_requests

CCM University

Designed for busy professionals, our free AIA/IIBEC approved online courses give you the continuing education you need — no matter where you are! After completing a short quiz, you'll have instant access to your certificate, and we'll submit your credits to the AIA. Browse the catalog and look for the icon below to identify the e-Learning courses.

To get started, just log in or create a new account. Visit CCM University by [clicking here](#) or at the link below:

www.ccm-university.com/account/syntec/register

COURSE LEVELS

Beginner Courses - For individuals seeking to learn the fundamentals about a subject area

Intermediate Courses - For individuals seeking to build on, apply or enhance knowledge in subject area

Advanced Courses - For individuals with greatly developed knowledge and seeking to heighten their skill level

COURSE ACCREDITATION

Course approved for 1 American Institute of Architects (AIA) Learning Unit

Course approved for 1 IIBEC CEH hour

Course approved for 1 GBCI CE hour

Contents

Building Envelope Design and Implementation

The Building Envelope Solution	4
Pushing the Envelope	5
Building Envelope Design	6
Building Envelope Tie-In Design	7
Air and Vapor Barriers	7

Single-Ply Roofing Systems

Single-Ply Roofing Technology	8
Top 10 Reasons to Choose an EPDM Roof	8
Black Or White Membrane, What is the Sustainable and Energy Efficient Choice?	9
Evolution of White EPDM	10
TPO Technology	10
PVC Roofing Materials	11
Understanding PVC & KEE Membrane ASTM Standards	12
Fleece Membranes and Urethane Adhesives	13
Tapered Polyiso Insulation	14
Insulation Characteristics	14
The Role of Cover Boards In Roofing	15
Adding Insulation on Height-Restricted Roofs	15

Roofing System Performance and Resiliency

Designing for Performance	16
Moisture Migration: Causes and Cures	17
Performance Influence: Roofing Assemblies' Interface With Decks	18
Roofing Wind Speeds: ASCE 7, Uplift Ratings, and Warranties	18
New Concrete Roof Decks	19
FM 4474 Wind Uplift Testing	19
Roof Assembly Fire Testing for Code Compliance	19

Specialty Roofing Accessories And Systems

Daylighting: Benefits, Basics, and New Solutions	20
All About the Edge	20
Vegetated Roofing Systems	21
Electronic Leak Detection	21
Rooftop Amenity Space	22
Cold Storage Roof System Considerations	22
The Perimeter Roof Edge	23

Building Envelope Design and Implementation

THE BUILDING ENVELOPE SOLUTION

Description: The building envelope consists of all exterior components of a building –roof, walls, below-grade waterproofing, windows, skylights, and so on. When looking at these components, it is important that each is taken into consideration to prevent moisture or air from migrating into the building. The envelope is a complicated and integral part of any high-performance building; however, it is often the most neglected portion. This presentation aims to educate the participants on the importance of the building envelope and how the individual components within the system must be designed and constructed to ensure a long-lasting, energy-efficient building.

Learning Objectives:

1. Recognize the importance of building envelope systems.
2. Identify and select performance-based products for foundations, walls, and roofing systems that ensure a proper physical barrier between the inside conditioned space and the outside elements.
3. Learn about proper design, best practices and installation techniques of key building envelope components and systems.
4. Explore basic tie-in detailing for roof to wall, wall to below grade, and below grade to blindside systems.

Solutions From the Ground Up

PUSHING THE ENVELOPE - GOING BEYOND CONCEPTUAL DESIGN

Description: Over the past several years, the building envelope concept has been well promoted and established as a means for energy efficiency and building performance. With the vast array of products available today comes confusion and misinformation. Building designers are often left guessing about product compatibility and proper design, leading to the potential of costly failures. The focus of this presentation is to dive deeper, beyond the concept, and into proper building envelope design. The presentation aims to educate attendees on proper product selection and performance characteristics, codes and testing, and proper tie-in detailing to ensure a continuous air seal.

Learning Objectives:

1. Recognize what is at stake with improper building envelope design and discuss the building types that benefit the most from building envelope systems. In addition, we will discuss the codes requiring proper building envelope design and what is being required.
2. Learn how to select and properly install functional air and vapor barriers for roof, wall, and below-grade applications.
3. How to use a holistic approach for examining and selecting exterior continuous insulation options for rainscreen wall assemblies. We will analyze popular exterior continuous insulation options with an emphasis on selecting a material that functions well during all weather conditions.
4. Identify several common material and system tests required to meet building energy and safety codes.

BUILDING ENVELOPE DESIGN: UNDERSTANDING CODES, BEST PRACTICES, AND TIE-INS

Description: Building envelope systems and continuous air barriers have gained prevalence in the marketplace with inclusion into building and energy codes over the last decade. This presentation aims to bring awareness of code requirements as they relate to building envelope components and systems and shed light on common material misconceptions. Additionally, this presentation will focus on the all-important tie-in junctions which have been known to cause confusion resulting in leaky buildings and system failure. We will discuss tie-in design considerations, known product incompatibilities, as well as tie-in installation best practices.

Learning Objectives:

1. Gain an understanding of building and energy code requirements as they relate to the building envelope.
2. Explore material and installation best practices for below-grade waterproofing, above-grade walls, and roofing systems.
3. Address myths and common misconceptions about certain building envelope components.
4. Analyze best practices for tie-in design and installation.

BUILDING ENVELOPE TIE-IN DESIGN

Description: Tie-ins between dissimilar materials and systems are unavoidable when designing a building envelope system. As important as tie-ins are, there is very little information on material compatibility and proper design. This nano course provides some best practices for tie-in design and shows how costly tie-in failures can be avoided by proper planning and sequencing.

Learning Objective:

1. Explore several industry-wide best practices for building envelope tie-in design.

Educational Content: Intermediate

INTERMEDIATE

AIR AND VAPOR BARRIERS: ARE YOU COMPLETING YOUR BUILDING ENVELOPE?

Description: This presentation is an introduction to the evolution of the roofing system and understanding the various material options for rooftop air and vapor barriers. This course will review the importance of completing the building envelope to control moisture, vapor, air, and thermal. Not controlling air movement within the roofing system can cause condensation issues and reduce the building's energy efficiency.

Learning Objectives:

1. Learn about the evolution of roofing systems and how past assumptions don't meet today's needs.
2. Understand how air can carry moisture into the roofing system and reduce energy efficiency.
3. Understand the various material options for air and vapor barriers.
4. Review the importance of a complete air and vapor barrier "system".

Single-Ply Roofing Systems

BEGINNER

SINGLE-PLY ROOFING TECHNOLOGY

Description: This one-hour session will include topics ranging from industry issues such as enhanced roofing system design options to market trends including ANSI/SPRI ES-1 for metal edging, ASCE 7, and the International Building Code, as well as roof system warranties. This presentation will focus on the role single-ply membrane plays in today's roofing market and its impact on tomorrow's roof system performance.

Learning Objectives:

1. Learn the basic roof components including insulation, fasteners, adhesives, and typical and nonstandard roofing assemblies.
2. Recognize differences in warranty language to benefit the building owner.
3. Understand the differences between EPDM, TPO, and PVC.
4. Understand the need for proper uplift design in respect to certification, roof assembly, and perimeter edge.

TOP 10 REASONS TO CHOOSE AN EPDM ROOF

Description: This presentation is designed to help architects, specifiers, consultants, and building owners understand the primary reasons why they may want to upgrade to an EPDM rubber roof. A basic understanding of available commercial roofing options is helpful but not absolutely necessary to gain insight from this program.

Learning Objectives:

1. Learn about the time-tested, superior weathering and hail resistance characteristics of EPDM.
2. Understand that not all 60-mil membrane options are created equal when it comes to the amount of weathering material.
3. Understand how selection of roof color can impact energy efficiency, rooftop safety, and the potential for condensation problems.
4. Learn about significant differences between seaming EPDM and thermoplastic membranes.

BLACK OR WHITE MEMBRANE, WHAT IS THE SUSTAINABLE AND ENERGY EFFICIENT CHOICE?

Description: The one-hour session will cover the energy impact of roof color based on various geographic regions along with a review of the performance trade-offs and other considerations that go into a sustainable roofing system design.

Learning Objectives:

1. Learn about which geographic regions are best suited for “cool” or highly reflective roofs from an energy perspective.
2. Learn about the heating penalty associated with cool roofs and how that impacts energy consumption/costs.
3. Learn about differences in the weatherability and hail resistance of various roofing membranes.
4. Learn about potential unintended consequences associated with using cool roofing in heating-dominated central and northern climates.

INTERMEDIATE

EVOLUTION OF WHITE EPDM

Description: Since the introduction of white EPDM roofs in 1987, numerous enhancements have been made to the membrane and system components, making today’s white EPDM systems far more robust and a greater value than ever before. There are four main areas in which major enhancements have been made to white EPDM system technology, improving performance and increasing value. With 34 years of evolution based on field experience, white EPDM is time-tested and built to last.

Learning Objectives:

1. Improvements to the membrane – Learn about the significant improvements in UV resistance for white EPDM and the expansion of width options to improve productivity.
2. Improvements to seams – Seaming technology is another area of evolution where we will learn about the transition from liquid-applied seam adhesives to peel & stick tapes and then pre-applied seam tapes.
3. Improvements to puncture resistance – Learn about new sheet options that offer added puncture resistance, among other important attributes.
4. Improvements to flashing details – Details are an extremely important part of any roofing system and we will learn about the numerous enhancements made to white EPDM flashing products.

TPO TECHNOLOGY: UNDERSTANDING PROVEN PERFORMANCE AND THE MOST RECENT DEVELOPMENTS

Description: This course reviews the basics of TPO roofing systems and discusses the latest in TPO roofing technology and performance improvements. TPO membrane is the most widely used low-slope roofing material in North America, accounting for more than half of all low-slope roofs installed each year. Thus it is of utmost importance that designers are familiar with TPO membranes and roofing systems. The course also discusses new products, systems, and accessories that have been developed to enhance the securement, longevity, and speed of application of these roof systems. Finally, the course discusses how to specify TPO roof systems to meet building codes, life safety requirements, environmental and sustainability goals, and building owner protection requirements.

Learning Objectives:

1. Learn about the attributes of TPO roofing.
2. Explore the weathering and performance characteristics of TPO roofing systems.
3. Understand how to design a TPO roofing system with various attachment methods to ensure performance.
4. Understand product selection and solutions to increase reflectivity, recycle TPO, and maximize the environmental benefits of a TPO roof.

Description: This course will describe the many benefits of using a white reflective PVC roofing membrane, including saving energy and reducing the use of fossil fuels. The question of which buildings should consider PVC roofs will also be discussed.

Learning Objectives:

1. Learn the history of PVC and its benefits to the environment and building occupants.
2. Understand how PVC membranes fit within building codes for fire resistance and within industry energy programs promoting sustainability. Review studies on the material's service life so the designer is more prepared to discuss PVC options with the building owner.
3. Learn how the characteristics of PVC roofing membranes can help prevent the spread of fire and how PVC membranes use less fossil fuels than other thermoplastics.
4. Learn how decisions about different roofing components, such as the thickness, scrim choice, and formula in the manufacturing of PVC roofing membranes can affect buildings and their occupants.

UNDERSTANDING PVC & KEE MEMBRANE ASTM STANDARDS

BEGINNER

Description: This course will outline PVC & KEE Membrane ASTM standards D4434 and D6754. It will explain the key aspects of each standard, describe the notable requirements, and help specifiers make more informed decisions when specifying PVC or KEE-based roofing membrane.

Learning Objective:

1. Understand the key features of, and differences between, PVC-based membrane standards ASTM D4434 and ASTM D6754.

Educational Content: Beginner

FLEECE MEMBRANES AND URETHANE ADHESIVES – INDUSTRY-LEADING PERFORMANCE

Description: In this program the participants will learn about the physical characteristics of different types of fleece-backed single-ply membranes, including EPDM, TPO, PVC, and KEE HP, as well as the benefits of the addition of fleece to the membranes. Benefits of two-part urethane adhesives will be discussed, including reducing VOCs and adhesive odor risks, product performance, different methods of application, and packaging. We will review case studies on new construction and re-roofing options, then discuss the benefits to the building owner as well as the sustainability and durability of the roofing assembly.

Learning Objectives:

1. Learn the physical properties and uses of fleece-backed membranes.
2. Understand the benefits of urethane adhesives and how they can be environmentally friendly.
3. Recognize the options that could assist building owners with unique concerns, including re-roofing or odor infiltrations.
4. Understand the potential for a durable and sustainable roof assembly by combining proper components with correct design considerations.

INTERMEDIATE

TAPERED POLYISO INSULATION: COMMERCIAL ROOF SYSTEMS

Description: The goal of tapered roof insulation systems is to reduce or eliminate the amount of ponding/standing water on the finished membrane when the roof deck does not provide adequate slope. Draining the water in a timely and efficient manner minimizes the adverse effects that ponding/standing water can have on roof membranes. A properly designed tapered roof insulation system not only provides the positive drainage needed, it also helps extend the life of the roof membrane and provides thermal value, reducing the heating and cooling expenses of the building owner.

Learning Objectives:

1. Understand the features and benefits of tapered polyisocyanurate insulation.
2. Identify and understand key terms in a tapered insulation system: panel, profile, and slope.
3. Identify specific design questions to consider when comparing tapered quotes: minimum R-value, slope, squares of fill, 2-way or 4-way design.
4. Accurately compare different tapered designs and quotes.

INSULATION CHARACTERISTICS IN LOW-SLOPE ROOFING APPLICATIONS

Description: Course will describe insulation and its associated applications in commercial low-slope roofing related to energy-efficient design, fire resistance, code compliance, and enhancing building resiliency.

Learning Objectives:

1. Explain insulation's attributes related to its use in energy-efficient roof systems.
2. Understand thermal resistance values and design best practices for providing long-term thermal efficiency of the building envelope.
3. Design a roof system's thermal envelope to ensure the safety and well-being of its occupants through effective environmental separation.
4. Discuss application solutions to meet building code requirements for energy efficiency and fire resistance.

DESIGNING FOR PERFORMANCE – SINGLE-PLY ROOFING LESSONS LEARNED

Description: Designing for performance is based on single-ply roofing installation conditions that provide the best practice approaches, including case studies and slides showing conditions and remedies. The presentation provides an overview of areas of single-ply roof system design, including but not limited to: industry concerns, metal edging, air infiltration, flashings, membrane securement, insulation adhesion, membrane adhesion, insulation options, and membrane details.

Learning Objectives:

1. Understand the importance of perimeter securement and edge metal systems.
2. Recognize the importance of pre-construction meetings and installation monitoring for a successful installation.
3. Learn how to identify causes and possible results of air infiltration into roofing systems.
4. Learn methods to enhance the long-term performance of single-ply membrane systems.

MOISTURE MIGRATION: CAUSES AND CURES

Description: Advances in product technology and building codes/standards have created unforeseen consequences, with moisture migration from different sources entering into the roof assembly and affecting its long-term performance. How the moisture moved into the assembly, the results, and the overlooked details shall be reviewed, as well as how to mitigate or correct these concerns prior to installation.

Learning Objectives:

1. Learn how moisture migrates through vapor drive and results in possible condensation.
2. Understand the sources of vapor moisture and how to control them.
3. Comprehend the concerns of modifying the use of a building without considering the roofing assembly.
4. Understand the issues about moisture in concrete, drying times, field testing, and roofing installation options

ADVANCED

PERFORMANCE INFLUENCE: ROOFING ASSEMBLIES' INTERFACE WITH DECKS

Description: With all the outside forces affecting building construction, such as the International Code Council, economic changes, and green standards to name a few, it is no wonder some decking materials have conflicted in interfacing with the roofing assemblies. Though these products are permitted by the building code, the weakness of the material to hold a fastener or adhesive for roofing jeopardizes the expected performance of the roofing assembly. To avoid concerns about long-term performance, it is important to understand the types of decking materials, their limitations, and how to improve architectural specification wording to meet code and long-term performance.

Learning Objectives:

1. Identify the difference between standard and non-standard decking materials.
2. Learn about the limitations of specific materials and interface issues with roofing materials.
3. Understand the industry positioning about these conditions.
4. Realize how to avoid this potential concern at the detail and design stage and not at the jobsite.

ROOFING WIND SPEEDS: ASCE 7, UPLIFT RATINGS, AND WARRANTIES

Description: In the industry there is a need to sort out the confusion between building codes, uplift rated assemblies, and warranties by explaining what each offers and how they should be considered. To understand the building code, we need to review how uplift is determined and the industry's accepted rating method of roofing assemblies for comparison. After understanding the code criteria, discussion will focus on how roofing warranty wind speed coverage is regarded by the industry and building code will be reviewed for clarity.

Learning Objectives:

1. Review the changes within the latest version of ASCE 7.
2. Understand the differences in how warranty winds speeds are handled by roofing manufacturers and what to watch out for so the building owner receives the most comprehensive coverage.
3. Learn the basic design process for choosing the correct roofing assembly.
4. Understand how roof assemblies are tested and rated for uplift pressures.

ALL ABOUT THE EDGE

Description: An introduction to the design, testing, and performance of edge metal systems for low-slope roofs. This presentation will go over the basics of edge metal, describe the importance of the perimeter edge in relation to the total roof system, explain the history behind metal roof edge standards such as ANSI/SPRI/ES-1, discuss detail updates to roof edge standards, and explain performance and test ratings/protocol.

Learning Objectives:

1. Understand the importance of a quality perimeter roof edge.
2. Understand the ANSI/SPRI/FM-4435 ES-1 standard.
3. Understand test protocols that are followed and how performance ratings are established.
4. Understand how to specify certified edge metal and how to ensure it meets the IBC standards.

ELECTRONIC LEAK DETECTION TESTING, STANDARDS, SCIENCE, AND PRACTICAL APPLICATIONS

Description: This course will cover Electronic Leak Detection (ELD) testing methods used for quality assurance. Participants will learn about the principles outlined in the ASTM Standard Guide D7877 and ASTM Standard Practice D8231 and will be able to identify which assemblies are compatible with electronic testing.

Learning Objectives:

1. Recognize the differences between the four electronic testing methods for roofing and waterproofing membranes.
2. Understand the capabilities and limitations of electronic leak detection as outlined in ASTM Guide D7877 and ASTM Practice D8231.
3. Identify potential future design and construction failures based on analyzed data from real-time construction monitoring.
4. Distinguish different applications for fully monitored embedded leak detection systems and how they function.

ROOFTOP AMENITY SPACE

Description: Historically, rooftops were a place rarely thought about, visited, or utilized by building owners and their tenants. However, with the scarcity and extremely high cost of land in urban environments, building owners and designers have begun to recognize this once overlooked space. Over the last several decades, rooftop amenity space designs have been on the rise due to their ability to maximize useable space while staying within the building’s footprint. This nano course provides a brief introduction on rooftop amenity space systems, proper design of the underlying roof system, amenity space trends, and overburden options.

Learning Objectives:

1. Understand best practices in roof system design for overburden applications.
2. Discover industry trends for rooftop amenity space designs.
3. Learn about several rooftop overburden options and installation types.

Educational Content: Beginner

COLD STORAGE ROOF SYSTEM CONSIDERATIONS

Description: This presentation will bring knowledge of roof system design considerations when dealing with cold storage applications. The presenter will discuss various types of cold storage application techniques and provide insight on the importance of understanding internal climate zones and how they may impact design considerations for the roof system assembly. The presenter will discuss considerations for vapor barrier placement based on internal operation conditions as well as selection of insulation requirements. Focus on various insulation types, R value recommendations, and attachment options will also be discussed. The presenter will then discuss various types of single ply membranes as well as attachment options and considerations. The final and most critical segment will focus on detail considerations of the thermal envelope transitions. This will include wall to roof, roof to wall, internal climate transitions as well as roof penetrations. The presentation will end with a Q&A session and key takeaway points.

Learning Objectives:

1. The importance of understanding internal operations and condition.
2. ASHRAE recommended insulation R values & types.
3. Understanding of typical cold storage construction methods.
4. Vapor barrier consideration and proper placement.

THE PERIMETER ROOF EDGE

Description: This presentation will address current IBC code requirements and various metal edge designs and their wind uplift performance. Various options will be discussed, along with examples of selecting appropriate metal edge systems.

Learning Objectives:

1. Preview of old requirements vs. today's code mandates.
2. Standards and testing methods covering metal edge performance.
3. Examples of best practices and edge details.

LEVERAGING RESOURCES: MAKING GREAT PROCUREMENT DECISIONS

Description: Public agencies have several legal procurement avenues to help them secure products and services. The traditional bid system is not preferred by many agencies due to the inability to control the bidders. Many agencies have turned to cooperative contracts, which, when used properly, can help these agencies obtain the best materials, best services, and fair market pricing. However, some of these cooperative contracts exclude independent design professionals from helping public agencies develop the scope of work. These are the same contracts that have pricing that is significantly higher than most of the market.

This presentation will show you the differences between each procurement method and how they work. There is one avenue that empowers public entities to control their outcomes by working with design professionals and obtaining fair market pricing as well as the best products and contractors.

Learning Objectives:

1. Differentiate between the various public procurement options
2. Explain why TIPS-USA is the superior solution for public procurement
3. Recognize who to contact to learn more about TIPS-USA

ADHESIVE PULL TESTS: THE WHAT, WHY, AND HOW

Description: This course is intended to educate reps, consultants, and roofing professionals on CCM's procedures for requesting and administering adhesive pull tests.

Learning Objectives:

1. Understand what an adhesive pull test is.
2. Understand why an adhesive pull test is used.
3. Understand how to properly administer an adhesive pull test.

COMMERCIAL ROOFING TERMINOLOGY

Description: Single-ply membranes are among the most popular commercial roofing systems. This presentation provides a basic understanding of common terminology as it relates to single-ply roofing systems. The terminology covered throughout this presentation establishes a foundation essential for participants to understand and decipher roofing shop drawings and specifications.

Learning Objectives:

1. Explore basic roofing terminology as it relates to commercial single-ply roof systems.
2. Learn to visually identify many common rooftop conditions and products.
3. Gain a basic understanding of how and why certain rooftop products and conditions are implemented on commercial roofing projects.

FLEXIBLE FAST RIG SPLATTER

Description: This course is intended to educate reps, consultants, and roofing professionals on Carlisle SynTec's innovative application technique for two-part, low-rise adhesives. In this session, we will discuss potential business opportunities, application benefits, and approved equipment options. The short-term and long-term performance of an adhered roofing system are reliant on the consistency and uniformity of the adhesive. Without this consistency, performance issues can occur, compromising the health, safety, and welfare of the occupants. Rig Splatter application of Carlisle SynTec's flexible urethane adhesive greatly increases the consistency of the adhesive throughout the roofing system, allowing for greater confidence and peace of mind for the building's occupants.

Learning Objectives:

1. Understand the features and benefits of Rig Splatter with flexible urethane adhesive and how they relate to performance and efficiency.
2. Determine how Rig Splatter differs from other application techniques when specifying, bidding, or installing a project.
3. Identify the approved pieces of equipment to achieve Rig Splatter.

INSULATION AND COVER BOARDS

Description: Course will describe Polyisocyanurate Insulation and its associated applications in commercial low-slope roofing related to energy efficient design, fire resistance, and code compliance.

Learning Objectives:

1. Explore the attributes of polyisocyanurate insulation in energy efficient roof systems.
2. Understanding thermal resistance values and design best practices for providing long-term thermal efficiency of the building envelope.
3. Learn how to design a roof system's thermal barrier to ensure the safety and well-being of the building's occupants through effective environmental separation.
4. Understanding product solutions for maintaining building code requirements for energy efficiency and fire resistance.

OVERBURDEN SYSTEMS: ROOF GARDENS, PAVERS, AND LEAK DETECTION

Description: Over the last several decades, green roofing and rooftop amenity space designs have been on the rise due to their ability to provide environmental benefits and maximize useable space while staying within the building's footprint. This presentation will provide participants with an introductory overview of the overburden options available from Carlisle as well as pertinent warranty information. Electronic leak detection (ELD) testing, which is critically important for determining the waterproof integrity of the roof prior to overburden installation, will also be discussed.

Learning Objectives:

1. Gain a basic understanding of Roof Garden system types and installation methods.
2. Explore the Roof Garden products and systems available from Carlisle as well as the related warranty information.
3. Learn about the available rooftop paver products available from Carlisle and the related warranty information.
4. Gain a basic understanding of electronic leak detection (ELD) systems as well as Carlisle's preferred ELD technology.

PVC-KEE HP

Description: An introduction into Carlisle SynTec's PVC and KEE HP membranes and system offerings. This session will review some of the basics of PVC and KEE HP, discuss key differentiators of Carlisle's PVC and KEE HP products, and review basic product offerings and industry-leading innovations.

Learning Objectives:

1. Understand what makes Carlisle PVC and KEE HP products unique.
2. Become familiar with the basic product offerings.
3. Learn about the latest and greatest PVC products.
